

## AUTOMATED ADS REPORTING SYSTEM

# Your Meta & TikTok numbers, ready before you ask for them.

A fully automated pipeline that pulls your ad performance data every day, keeps it accurate even when conversions arrive late, and delivers the exact weekly & monthly reports you rely on — for every brand you manage, without you lifting a finger.

Meta Ads API

TikTok Ads API

n8n Automation

Google Sheets

Automated Email Reports

# The Problem

Media buyers lose real, billable hours every week to work that has nothing to do with strategy.

## Without automation

- Manually exporting Meta & TikTok data for every brand, every day
- Copy-pasting into spreadsheets and re-checking formulas
- Rebuilding the same weekly report from scratch, every Monday
- Numbers quietly change after a report is sent, because conversions attribute late
- Every new client means rebuilding the entire reporting sheet again

## With this system

- Data pulled automatically, every day, per platform, per brand
- Late-arriving conversions self-correct — no manual re-checking
- Weekly & monthly reports generate and send themselves
- Every new brand gets its own clean, ready-to-use report
- Your time goes to decisions, not data entry

## Daily

manual exports & data entry — eliminated

## Weekly

report-building session — eliminated

## Zero

extra setup work per new brand added

# How The System Works

The system is built as six connected workflows running on **n8n** (an automation engine), each with a specific job. Together they form one continuous pipeline: from raw ad platform data to a finished report sitting in your client's inbox.

**Core design principle:** raw data is captured once, stored durably per brand, and re-checked over a rolling window before every report. This means a purchase that Meta or TikTok attributes a few days late still lands in the right place — reports don't silently go stale the moment they're sent.

## Bringing on a new client

Two things have to happen once per client before the automation takes over — one on their side, one on yours. Neither can be skipped, but neither is repeated after that.

|                    |                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Client does once   | Grants the agency's Business Manager partner (reporting) access to their ad account — the same access-sharing step used with any agency, automated or not |
| You do once        | When the system emails you that a new brand was found, confirm their report email (and TikTok ID, if used) and mark them active — about 30 seconds        |
| From that point on | Sheet creation, daily syncs, and every weekly & monthly report run automatically, indefinitely, with no further action from either side                   |

# The Six Workflows, In Detail

## 1 Brand Auto-Discovery

Runs automatically every day at 5:00 AM

This workflow checks the connected Meta Business account for every ad account it has access to. Any ad account it hasn't seen before is treated as a new "brand" and added to a central Brand Registry — a control sheet that drives the rest of the system.

|                |                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------|
| What it reads  | The list of ad accounts visible to the agency's Meta Business Manager                                                        |
| What it writes | A new row per new brand in the Brand Registry, marked "needs setup" until confirmed                                          |
| Why it matters | You never have to remember to go looking for new clients in the system — it flags them and emails you the moment one appears |

## 2 Brand Sheet Provisioning

Runs automatically every day at 4:30 AM

For every brand marked "active" in the registry, this workflow makes sure two things exist: a permanent Raw Data sheet (created once, per brand) and this month's Report sheet (created fresh, once per calendar month), both copied from master templates. It then shares both sheets automatically with the client's email address.

|                |                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------|
| Creates        | "[Brand] - Raw Data" (once) and "[Brand] - Ads Report - [Month Year]" (monthly)                         |
| Automatically  | Shares both new sheets with the brand's designated report recipient                                     |
| Why it matters | Each client gets a clean, correctly-named, ready-to-use sheet without anyone manually copying templates |

## 3 Meta Account-Level Daily Sync

Runs automatically every day at 6:00 AM

Pulls account-wide Meta performance — spend, impressions, reach, purchases, purchase value, and every derived metric (ROAS, CPM, CTR, AOV, conversion rate) — for every active brand, and logs it day-by-day into that brand's Raw Data sheet.

|                        |                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------|
| Pulls                  | Spend, impressions, reach, frequency, clicks, add-to-cart, checkout, purchases, purchase value |
| Self-correcting window | Re-checks the last 7 days on every run, so late-attributed purchases update automatically      |
| Reliability            | Automatic retries on network errors; email alert if a pull fails or returns no data            |

## 4 Meta Ad-Level Daily Sync

Runs automatically every day at 6:15 AM

Goes one level deeper than Workflow 3 — pulling performance for every individual ad running in each brand's account, including which creative each ad uses. This is what powers the "which ad/creative is actually working" view in the final report.

|                |                                                                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pulls          | Per-ad spend, CPM, clicks, landing page views, add-to-cart, checkout, purchases, and a derived "Creative Key" grouping ads that share the same creative |
| Handles scale  | Automatically pages through results for accounts running large numbers of ads                                                                           |
| Why it matters | Powers the ranked "Ad Performance" and "Creative Rollup" views clients actually act on                                                                  |

## 5 TikTok Daily Sync

Runs automatically every day at 6:30 AM

The TikTok equivalent of Workflows 3 and 4 combined — pulling both account-level and ad-level performance for every

active brand with a TikTok presence, into the same Raw Data sheet alongside the Meta numbers.

|             |                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Pulls       | Spend, impressions, reach, CPM, CTR, profile visits, follows, add-to-cart, checkout, purchases and purchase value — account-wide and per ad |
| Reliability | Same retry-and-alert protection as the Meta syncs                                                                                           |

## 6 Report Generator & Email

*Runs automatically every Monday at 7:00 AM, and on the 1st of each month at 7:15 AM*

This is where raw numbers become a finished report. For every active brand, it reads the full month-to-date raw data, calculates every metric across nine report views, writes the results directly into that brand's monthly Report sheet, and emails a summary straight to the client.

|                       |                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Builds                | Meta Overview, Meta Ad Performance (ranked), Meta Creative Rollup, Meta Weekly Trend, the same three views for TikTok, plus a Combined Meta + TikTok summary |
| Delivers              | An email to the client with headline spend, purchases and ROAS numbers, plus a link to the full report                                                       |
| Runs on both cadences | Weekly for a fresh check-in, monthly to close out and archive that month's report                                                                            |

# Built for Accuracy, Not Just Speed

---

## Attribution windows are handled automatically

Meta and TikTok both attribute some conversions several days after they happen. Instead of pulling "yesterday" once and moving on, every sync re-checks the trailing 7 days on each run — so a report generated today reflects purchases that were still settling when they happened, without anyone manually re-pulling old data.

## Nothing is guessed

Every number in every report traces back to a row of raw daily data pulled directly from Meta's or TikTok's own reporting API. There's no manual entry step where a mistake can creep in between the ad platform and the client's report.

## Failures are surfaced, not silent

If a data pull fails or an ad account returns nothing, the system sends an alert rather than quietly serving an incomplete report. A missing number is a flagged problem, never a guess.

## Client data access, handled the secure way

Access to each client's ad account is granted the way agencies normally work with clients — as a partner on their Business Manager, scoped to reporting access only. No passwords or raw account credentials ever change hands.

# What This Means For You

---

Every brand you manage gets its own clean, always-current report — without adding a single hour of manual work as your client list grows.

- **Onboard a new client in minutes**, not hours — once they grant access and you give a 30-second confirmation, sheet setup and reporting run themselves from day one.
- **Never miss a weekly or monthly report** — it's sent on schedule, every time, with no one needing to remember.
- **Spend your time on strategy** — deciding where to move next week's budget — instead of rebuilding spreadsheets.
- **Scale without adding headcount** — ten brands cost the system no more manual effort than one.

This system was built to run itself. Once a brand is connected, everything from that point forward — daily data collection, weekly check-ins, and the monthly report your client opens — happens without anyone needing to touch it.
